*Unfortunately it is not better and indeed not good enough. I have some files which look like they have been **generated as epub files by Microsoft Word**, and the count_pages algorithm produces text which is about four times larger than ebook-convert. (A quick glance shows thousands of font-family entries which have not been removed by count_pages).*

AFAIK Microsoft Word itself is incapable of creating EPUB files directly.

The ePUBTools Word addin can create EPUBs from within Word, and there are a number of tools, including calibre, that will convert MS Word's native format DOCX files to EPUB.

Added: InDesign is a more likely candidate as the source of poorly formed EPUBs.

BR

If you care about speed use the `extract_text()` function from `calibre.db.fts.text`

Thank you. That looks to do what I want. It does not produce the exact same results as ebook-convert but ignoring formatting and white-space issues its is extremely close. I tried it on about 1000 books and the worse case was still 99% similar and the vast majority of them were over 99.9% similar.

Also only takes about 1/20 of the time to call ebook-convert.

Thanks again.

Quoth

the rook, bossing Never.

Calibre converting docx to epub works better than the plugins I've tried on Word & LO Writer. It seems to work better than Indesign and other commercial tools judging by the commercial ebooks from big publishers.

Indesign should only be used for fancy colour coffee table books and glossy magazines.

Calibre is jjust about perfect from properly formatted docx (made by Word or extra Save As in LO
